(U) QUANTUMTHEORY CT Successes

From WikiInfo

(TS//SI//REL TO USA, FVEY) CNE Implant Deployed to Iran-based AQ Global Coordinator Muhsin al-Fadil (ANCIENTBREW)

(TS//SI//REL TO USA, FVEY) On June 8th the CT MAC successfully exploited and deployed TAO's first-stage implant (VALIDATOR) to system used by Muhsin al-Fadli (aka Dawad al-Asadi) using a QUANTUM technique against a Yahoo selector associated with Muhsin's (QUANTUMCOWBOY). After determining that Kaspersky 2012 was installed on target CT MAC analysts gained Mission Director approval to install TAO's second stage implant – UNITEDRAKE. UNITEDRAKE, prepackaged with keylogger (GROK) and USB monitoring/collection capability (SALVAGERABBIT), was deployed interactively on June 19th and the implant has already revealed multiple successes to include new insights on individuals collocated and working with Mushin in Zahedan, Iran. CT MAC analysts will continue to monitor the health and status of the implant which has already provided S2I13 and S2I21 access to communications that were not previously collected between AQAP and Muhsin al-Fadhli and provides key fidelity on the ongoing AQAP threat stream. Additional information obtained has provided insight into previously unidentified selectors, materials potentially associated with document forging, and new insights on Muhsin as well as individuals collocated with and working with Muhsin in Zahedan, Iran. The information on document forging is of particular interest as a number of AQ elements and affiliates, including AQAP jihadist involved in terror attack planning against Europe, have expressed interest in forged documentation.
